

CLAIMS

WHAT IS CLAIMED IS:

- 1 1. A method for secure data transfer in a wireless networked
2 communication system, comprising the steps of:
 - 3 generating an encryption key within a first device of the
4 communication system;
 - 5 encoding the encryption key to form an encoded signal;
 - 6 transmitting the encoded signal to a second device of the
7 communication system remote from the first device;
 - 8 decoding the encoded signal at the second device to extract the
9 encryption key; and
 - 10 using the encryption key to encrypt and decrypt data for subsequent
11 wireless transmissions between the first and second devices.
- 1 2. The method of claim 1, wherein the encoded signal is an acoustic
2 signal.
- 1 3. The method of claim 2, wherein the acoustic signal is DTMF tones.
- 1 4. The method of claim 1, wherein the encoded signal is an infrared
2 signal.
- 1 5. The method of claim 1, wherein the step of decoding further
2 comprises the step of storing the decoded encryption key in memory.
- 1 6. The method of claim 1, wherein the step of decoding further
2 comprises the step of performing error detection to determine if an error has
3 occurred in connection with the reception or decoding of the encryption key.

1 7. The method of claim 6, further comprising the step of sending a
2 request for a retransmission of the encoded signal if an error is detected.

1 8. The method of claim 1, wherein the step of using the encryption key to
2 encrypt and decrypt subsequent wireless transmissions further comprises the step
3 of encoding the data into radio frequency signals.

1 9. The method of claim 1, further comprising the step of determining
2 whether a new encryption key is required.

1 10. A system for secure data transmission within a wireless
2 communication system, comprising:

3 a first device of the communication system, the first device having an
4 encryption key generator for generating the encryption key and a signal transmitter
5 for transmitting an encoded signal representative of the encryption key; and

6 a second device of the communication system, the second device
7 having a signal sensor for receiving the encoded signal from the first device and a
8 decoder device for extracting the encryption key from the encoded signal, the
9 encryption key being used to encrypt data being transmitted between the first and
10 second devices.

1 11. The system of claim 10 wherein the first device further comprises an
2 encoder device for encoding the encryption key into an encoded signal for
3 transmission.

1 12. The system of claim 11 wherein the encoder device is an acoustic
2 codec.

1 13. The system of claim 10, wherein the encoded signal is an acoustic
2 signal.

1 14. The system of claim 10, wherein the signal transmitter is an acoustic
2 transmitter and the signal sensor is an acoustic sensor.

1 15. The system of claim 10, wherein the decoder device is an acoustic
2 codec.

1 16. The system of claim 10 further comprising memory in the first and
2 second devices for storage of the encryption key.

1 17. The system of claim 10 further comprising an encryption/decryption
2 module in the first and second devices for encrypting data for transmission and
3 decrypting data received from the other device.

1 18. The system of claim 10 further comprising a radio-frequency codec in
2 the first and second devices for encoding the data into radio-frequency signals.

1 19. The system of claim 18 further comprising a radio-frequency
2 transceiver in the first and second devices for transmission and reception of the
3 radio-frequency signals within the communication system.

1 20. A system for secure data transmission within a wireless
2 communication system, comprising:
3 means for generating an encryption key within a first device of the
4 communication system;
5 means for encoding the encryption key to form an encoded signal;

6 means for transmitting the encoded signal to a second device of the
7 communication system remote from the first device;
8 means for decoding the encoded signal at the second device to extract
9 the encryption key; and
10 means for using the encryption key to encrypt and decrypt data for
11 subsequent wireless transmissions between the first and second devices.
